

# Steps to make FB App work on DEV mode for testing

## requirements:

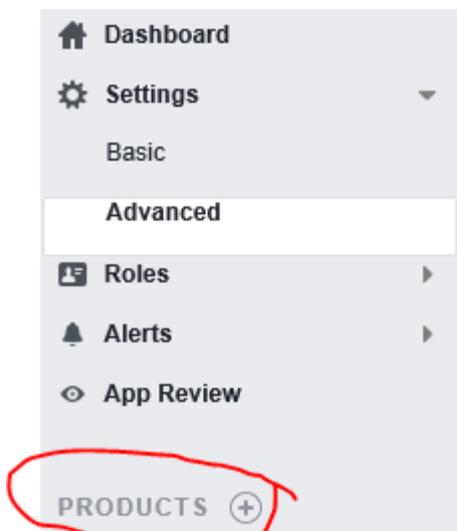

- Two Facebook users. One, that we'll call "developer" will create the FB APP and will assign the other user (called the "administrator") as TESTER of the Application. The "administrator" will be the pages' owner and the one that will authorize his account to be used on WebAdmin. The "tester" can post comments on the pages' wall and they will be injected to Campaigns' feed.
- Add the "**Facebook Login**" product to FB APP. This was necessary previously too

## steps:

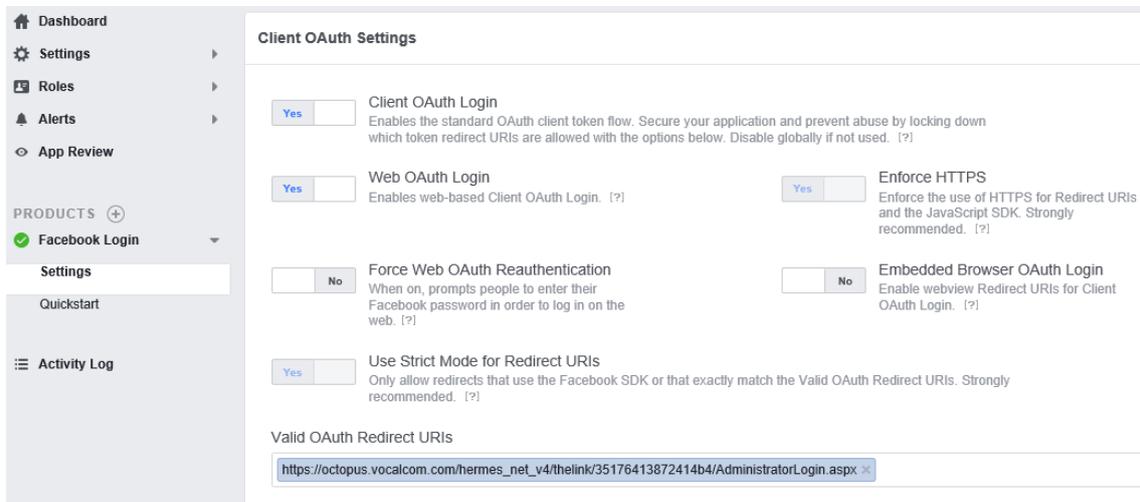

- go to <https://developers.facebook.com/apps>, login as your "**developer**" user and create a new APP

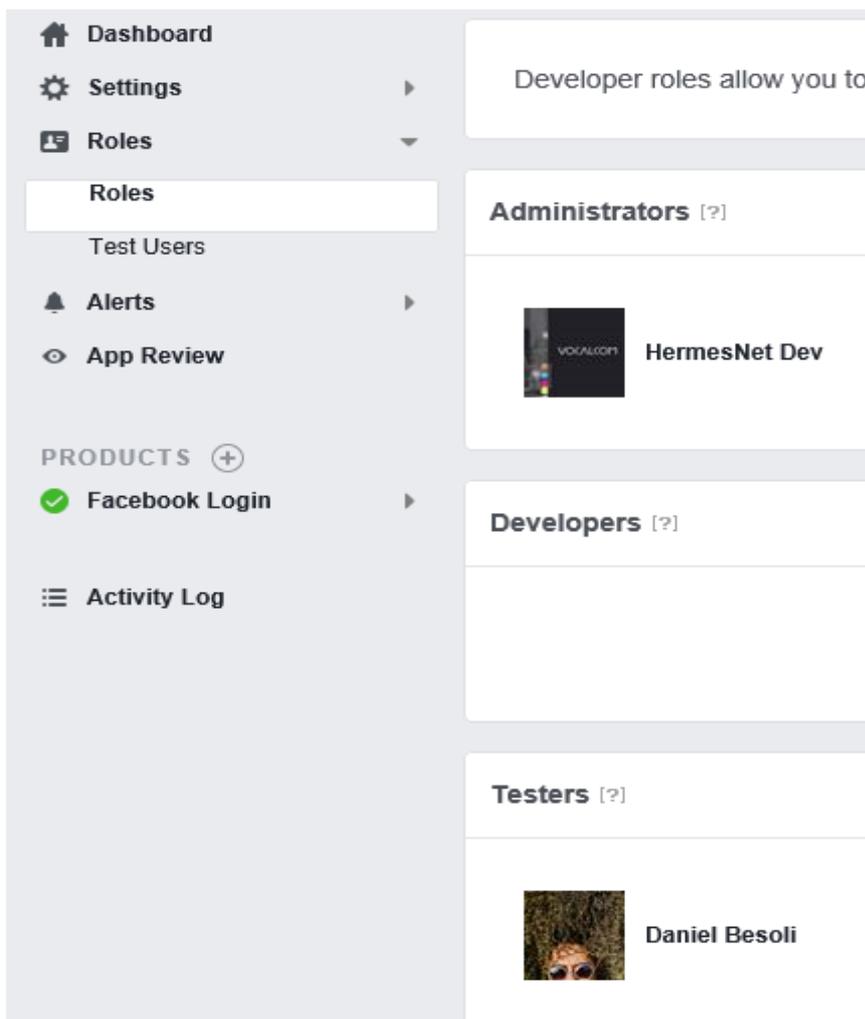

- fill the App Basic required fields
- add "Facebook Login" product using the [+] button

- configure the Valid OAuth Redict URIs with the URI found on your webadmin campaign

- On the Roles section add your test user as in the image below. The test user will be the one used to authorize the application from WebAdmin in the next step

- After this step reauthorize the campaign with the "**administrator**" Facebook user, enable the campaign and the feed will be collected again
